TrueSum

Bank Reconciliation Workpaper Suite

Month-end that proves to the cent.
One file, three exports, every bank account in every company reconciled in a single pass, built by an accounting team that reconciled six accounts by hand every month and got tired of it.

FOR FINANCE TEAMS RUNNING SAP BUSINESS ONE
Intake, Statement Proof, Matching Engine, Reconciliation Statement, Proposed Journal Entry, Decisions, Carry-Forward, Month History, J.E. Tracker and Workpapers

Why we built it

The tick-mark spreadsheet finally has a successor.

Most finance teams still reconcile the bank by hand: export the ledger, print the statement, tick the matches, retype last month's outstanding cheques. The numbers get there. The afternoon doesn't come back, and nobody can see how a figure was reached.

TrueSum Reconcile starts from the opposite premise. Every line on the statement is a bank line or an SAP entry, matched or carried, and every match shows the rows behind it. Clubbed ACH runs are broken back into the vendor payments that make them up; card settlements are proved day by day. What is left is either outstanding or a proposed journal entry, and an account only reads *Ready* at 0.00. All of it ships as one HTML file: no server, no login, no installation.

The spreadsheet workflow

- Clubbed ACH debits matched by trial and error
- Outstanding cheques retyped into next month's file
- Bank fees found at the end and keyed by hand
- A ten-cent difference means an hour of searching
- Reviewers see the answer, not the working

TrueSum Reconcile

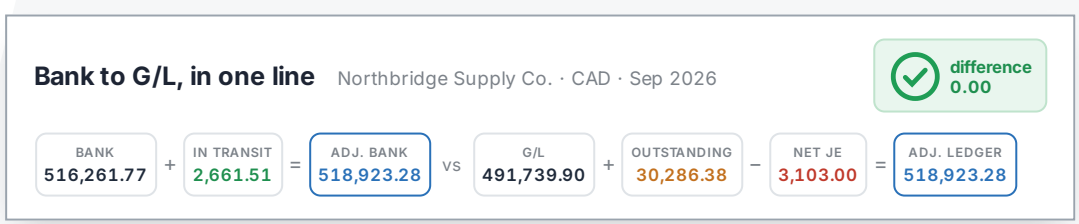

- ACH and payroll debits decomposed into the SAP payments behind them
- Carry-forward built from last month's saved workpaper, with what cleared
- A proposed JE line, G/L and memo for every bank-only item
- Near matches paired and the exact cent difference proposed
- Printed workpaper with statement, JE, open items and audit trail

1
Self-contained file; any modern browser

3
Workbooks in: balances, statement, SAP ledger

0.00
Residual required before an account reads Ready

0
Rows of your data uploaded anywhere

Every figure comes from the uploaded files: nothing is plugged. Both sides land on the same balance, and the status changes to Ready only when they do.

Ten parts, one pass, one workpaper.

Drop the month's three workbooks and every account in every company runs through the same engine. Each account gets its own tab, and the summary tells you which ones need you.

1 Month-end Intake

Upload the three workbooks together or one by one. Sheet names identify each bank account; the month is detected from the statement and can be overridden.

2 Statement Proof

Opening plus activity must equal the closing balance typed from the real statement. Value-dated lines that over-prove it are found and set aside, never forced.

3 Matching Engine

Cheques by number, deposits singly or grouped, ACH runs and payroll by batch, card settlements by day, near matches to the cent.

4 Reconciliation Statement

Bank to G/L in the A / B / C layout reviewers expect, with the G/L closing read from your export and editable on screen.

5 Proposed Journal Entry

Every bank-only line becomes a JE row: date, debit and credit G/L, memo and amount, ready to key into SAP.

6 Decisions Queue

Ambiguous charges wait for your choice of posting account; the JE and the statement update as you pick.

7 Outstanding & Carry-Forward

Outstanding cheques and deposits in transit, plus a register of exactly what rolls into next month.

8 Month History

Save the month and it becomes a tab. Next month picks up the carry-forward on its own and reports what cleared.

9 J.E. Tracker

Reconciliation JEs by G/L account and company, month over month and year to date, with direction arrows.

10 Workpapers & Controls

Print one tab or every account. Manual offsets are item-specific and saved with the month; there is no blanket override.

Near matches paired automatically SMALL BANK/SAP DIFFERENCES

BANK LINE	SAP ENTRY	BANK	SAP	DIFFERENCE
Sep 16, 2026 ACCOUNT PAYABLE PMT CEDAR LANE STORES	Sep 16, 2026 Incoming Payments - C00418 443186	1,540.73	1,540.63	0.10

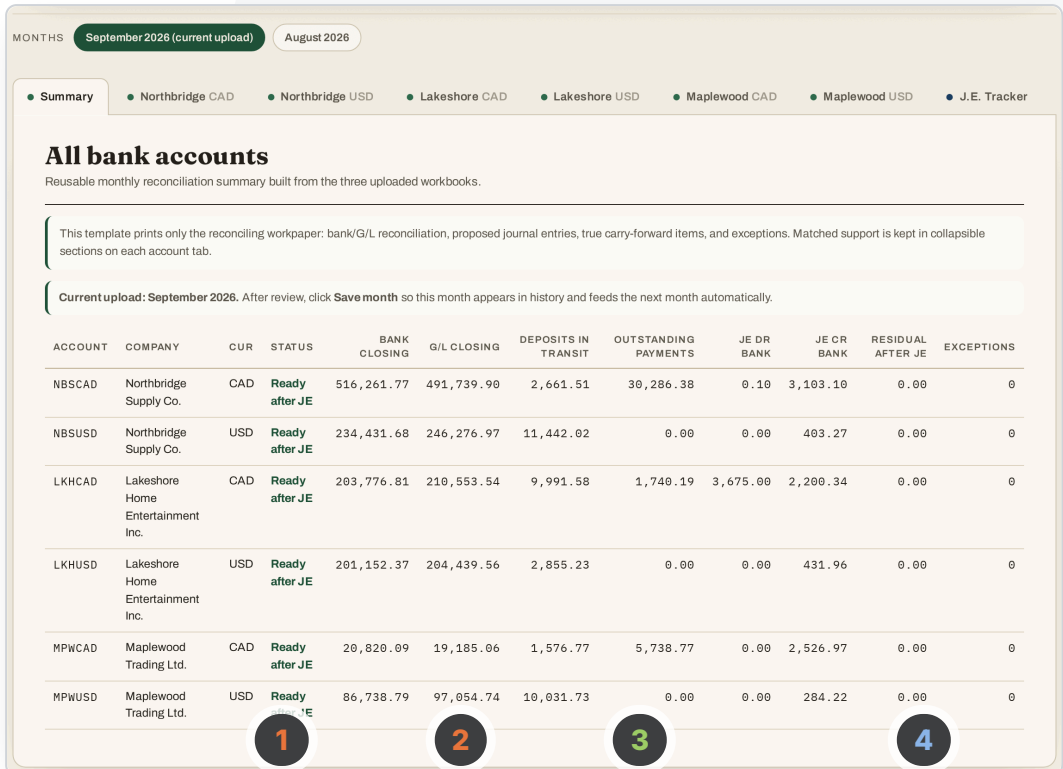

A deposit keyed ten cents off in SAP. The engine pairs it with the bank line instead of reporting two unrelated items, and proposes only the 0.10 difference.

Every account, one status line.

The first tab is the month at a glance: bank and G/L closing, items in transit, outstanding payments, the proposed JE and what is left after it, for every account in every company.

1. Status per account: Ready after JE, Needs review or Statement issue, decided by the same rules everywhere.
2. Bank and G/L closing balances side by side, read straight from your exports.
3. Deposits in transit and outstanding payments as totals; each account tab lists the rows behind them.
4. Residual after JE and the exception count: the two numbers a reviewer checks first.

Six accounts across three companies and two currencies in the demo; the setup is configured to your own entities and bank accounts.

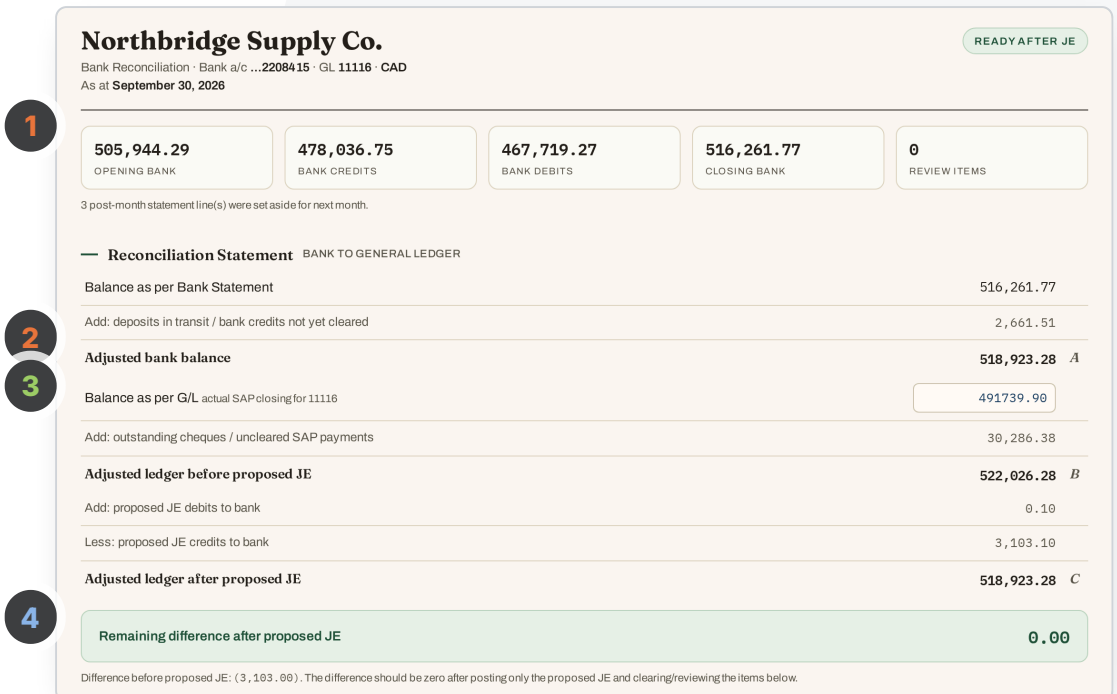

The statement your reviewer expects, already proved.

Each account tab opens with the reconciliation in the classic layout: adjusted bank, adjusted ledger before the JE, adjusted ledger after it, and the difference that remains.

1. Statement proof: opening, credits, debits and closing must agree before anything is matched. Lines dated after month-end are set aside and counted.
2. Adjusted bank balance: the statement closing plus deposits in transit.
3. G/L closing read from your balances workbook, editable on screen if SAP has moved since the export.
4. Remaining difference after the proposed JE. Zero turns the account green; anything else stays visible.

The closing balance you type from the real bank statement is authoritative. If the export over-proves it, the exact pending line is excluded rather than the figure overridden.

One bank line, six vendor payments. Unpicked.

The hardest lines on a statement are the ones the bank clubbed together. The engine works them back into the SAP entries they are made of, using exact cents, never "close enough".

1. ACH vendor runs: each debit is decomposed into the outgoing payments it pays, inside a bounded date window so later runs can't be borrowed.
2. Payroll PADs matched to the SAP payroll transaction as a whole group, never split across runs.
3. Card processor settlements proved day by day against SAP card receipts, net of chargebacks.
4. Cheques by number, counter deposits grouped, SAP reversals and duplicate postings offset internally.

A batch that can't be resolved exactly is listed for manual linking. It is never force-matched.

Proposed journal entry

The JE is written for you. You decide the edge cases.

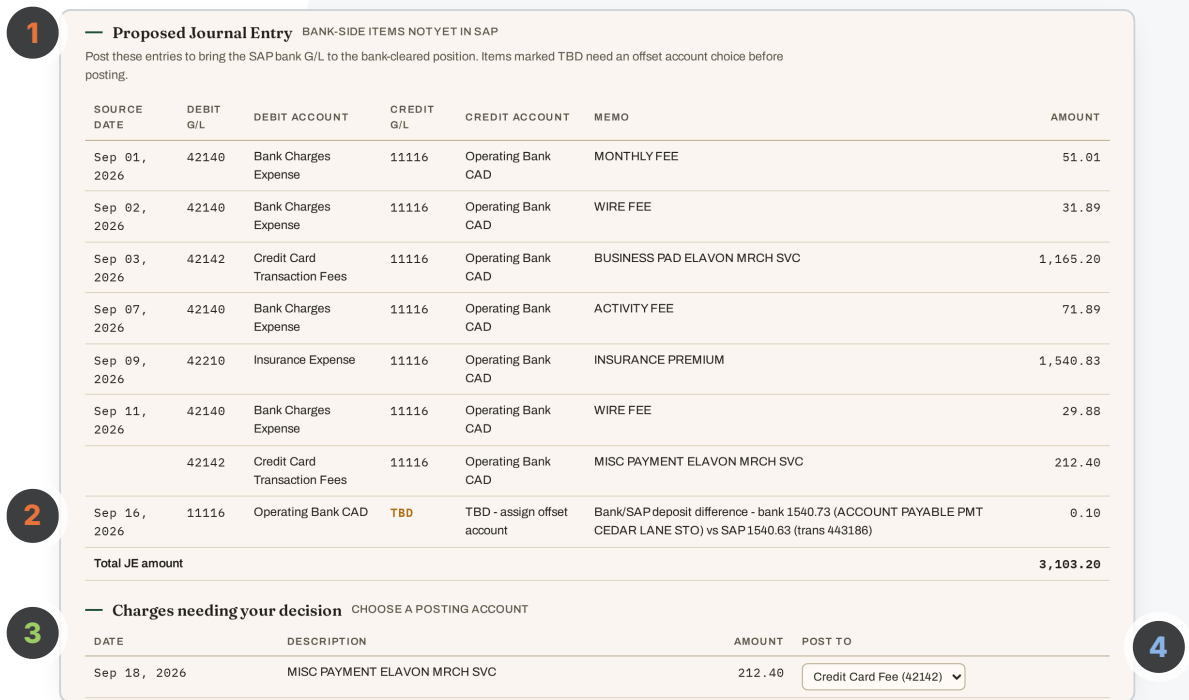

Bank lines with no SAP entry become a proposed journal entry, each with its date, G/L accounts, memo and amount. The reconciliation statement already includes it, so you can see the result before you post.

1. Bank charges, card-processing fees, insurance and loan interest are classified to their G/L accounts by descriptor rules set up for your bank.

2. Lines with no automatic account, such as a receipt SAP doesn't have yet or a ten-cent keying difference, are marked TBD so an account is chosen before posting.

3. Charges that could mean more than one thing, such as a card-processor debit, wait in the decisions queue with a default account.

4. Pick a different account and the JE, the statement and the J.E. Tracker update immediately.

Last month's open items, accounted for.

Save the month and it becomes a tab in the file. When next month's workbooks go in, the carry-forward loads itself and every brought-forward item is reported as cleared or still open.

1. Carry-forward register: exactly what rolls into next month, by type, cheque number and SAP reference.
2. Brought forward from prior month: each item with how it cleared this month, or flagged as still outstanding.
3. SAP re-lists open prior-month items in each export; the engine recognises them as the same item, so nothing is counted twice.

Saved months stay inside the master file and the browser, and can be backed up as a single HTML or a history file.

1

Carry-forward register TO OCTOBER 2026

CARRY AS	DATE	CHEQUE #	REFERENCE	REMARKS	AMOUNT
Outstanding payment	Sep 29, 2026	30227	442970	Outgoing Payments - V00580	10,416.40

2

Brought forward from prior month CARRY-FORWARD TRACKING

Prior open items are picked up automatically: the SAP export already re-lists every still-unreconciled item (end-date filter), and the saved month register loads itself from history. Nothing needs to be pasted or re-keyed - this register only reports what happened to each item this month.

TYPE	REFERENCE	AMOUNT	STATUS THIS MONTH
Outstanding payment	441563	8,634.55	STILL OUTSTANDING
Outstanding payment	441583	5,714.97	CLEARED BY BANK DEBIT - CHQ#00030220
Outstanding payment	441602	6,250.59	CLEARED BY BANK DEBIT - CHQ#00030221
Deposit in transit	441717	9,558.24	CLEARED BY BANK CREDIT - DEPOSIT

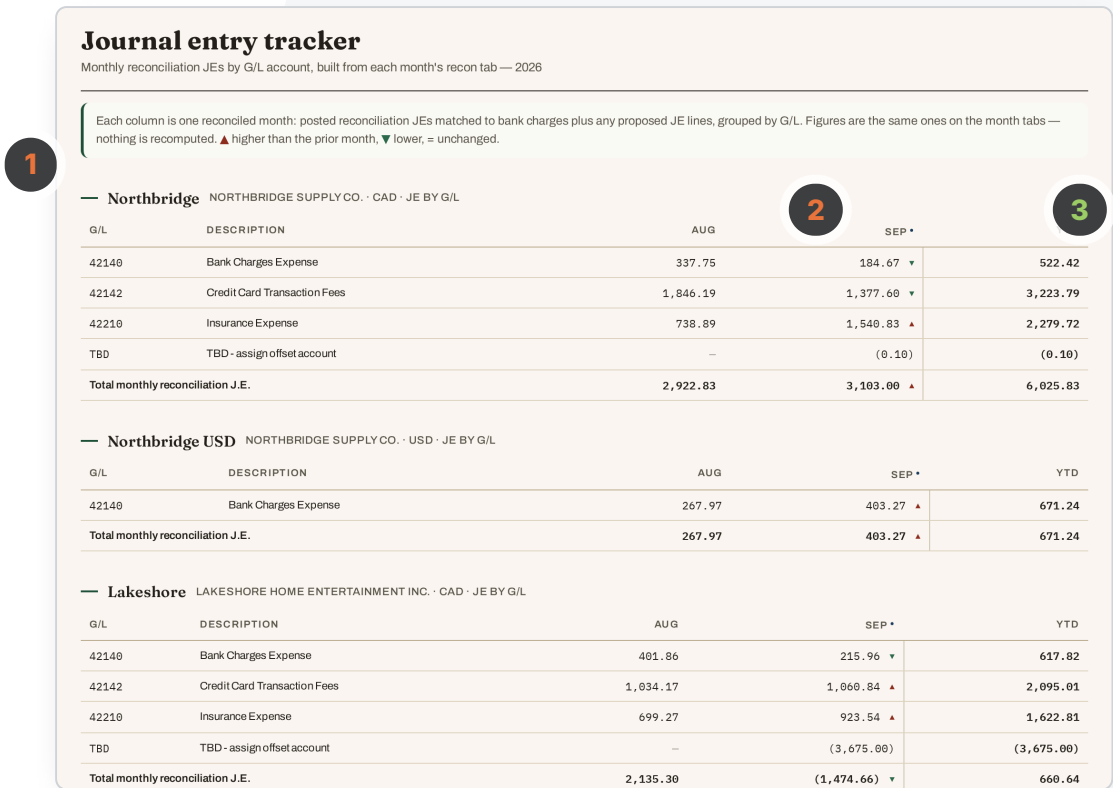

3

Where the bank costs went, month after month.

The tracker collects the reconciliation JE from every saved month and the current one, grouped by G/L account for each company and currency. The figures are the same ones on the month tabs; nothing is recomputed.

1. Every company and currency in its own block, with the G/L description beside each account.
2. Month columns with arrows showing which costs rose and which fell against the prior month.
3. Year-to-date totals per G/L account and for the monthly reconciliation JE as a whole.

The same JE-by-G/L table prints inside each account's workpaper, so reviewers see it on paper too.

Journal entry tracker

Monthly reconciliation JEs by G/L account, built from each month's recon tab — 2026

Each column is one reconciled month: posted reconciliation JEs matched to bank charges plus any proposed JE lines, grouped by G/L. Figures are the same ones on the month tabs — nothing is recomputed. ▲ higher than the prior month, ▼ lower, = unchanged.

Built for the reviewer as much as the preparer.

Reconciliations get printed, initialled and filed. The workpaper is designed for that page, and the rules behind it are designed so the numbers on it can be defended.

1 No plugged figures

Every amount on the workpaper is traceable to the bank statement or the SAP export. The engine never invents a balancing number to make an account close.

2 One rule for open items

An SAP entry not on the bank is outstanding. A bank line not in SAP is a proposed JE. Same-amount items are labelled so twins are never confused.

3 Specific manual offsets only

Known corrections are offset item by item and saved with the month. There is no blanket "mark as reconciled" switch.

4 Print what matters

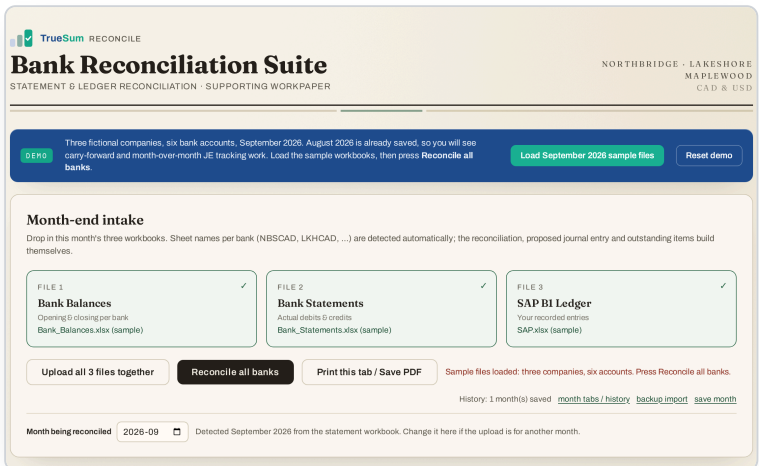

Print the active tab or every account. Matched support stays in a collapsible audit trail, so the printout carries the statement, JE, open items and sign-off.

5 Cross-account review

Anything left unexplained in one account is checked against the others, so a payment booked in the wrong company surfaces with its counterpart.

6 Re-run to converge

Post the JE, refresh the SAP export and run again: items already reconciled in SAP drop out, and the JE is never applied twice.

From SAP export to a reviewed workpaper in four steps.

Built and refined on SAP Business One and Canadian business-bank statement exports. Any bank that exports description, date, serial number, debit and credit columns to Excel can feed it.

1

Export three workbooks

Bank balances (opening and closing per account), the bank statements, and the SAP B1 bank-account export, one sheet per account.

2

Drop them on the page

Files are recognised by content, accounts by sheet name, and the month from the statement. Last month's carry-forward loads itself.

3

Review and decide

Work through accounts that aren't green, choose posting accounts for flagged charges, and print the workpapers.

4

Post and save

Key the proposed JE into SAP, re-run on a fresh export to confirm, then save the month for next month's carry-forward.

How it fits your business

Your data stays yours

The suite is a file on your computer or network drive. Workbooks are read in the browser; nothing is uploaded, indexed or seen outside your business.

No IT project

No server, database, licence server or installer. It opens in Chrome or Edge, and sharing a workpaper is sending a file.

Verified behaviour

Every engine change is tested against real monthly files and unit fixtures, with regression checks that untouched accounts produce identical output.

See it reconcile your own month.

What you receive

The Reconciliation Suite as a single HTML file, with your saved history kept inside it

Configuration of your companies, bank accounts, G/L accounts and bank descriptor rules

The export layout for the three workbooks, with the SAP Business One bank-account export

A demo file on fictional data for training and onboarding

Updates as the suite evolves, delivered as a replacement file that keeps your saved months

Get in Touch

For pricing, multi-company licensing, or a guided demo using a sample of your own bank and SAP exports, please contact us.
