TrueSum

Sales Intelligence
Analytics Suite

Distributor analytics that reconcile to the invoice.
One file, every number clickable, built by a distribution team that lived in Excel pivots for years and got tired of it.

FOR DISTRIBUTORS, IMPORTERS AND WHOLESALE BRANDS
Command Center, Dealer 360, Price·Volume·Mix, Recovery Ledger, Report Builder, Campaigns, Inventory & Backorders, Reps, Brands and Settings

See it running on your own numbers.

What you receive

The Sales Intelligence Suite as a single HTML file, with Excel export bundled

The data template workbook and the SAP Business One query set

Configuration of dealer merges, book transfers, brand status and marketplaces for your business

Rep export and email set-up, including the email mapping sheet

Updates as the suite evolves, delivered as a replacement file

Get in Touch

For pricing, multi-company licensing options, or a guided demo using a sample of your SAP export, please contact us.

The yearly pivot file finally has a successor.

Most distributors run their sales review on a spreadsheet that was clever five years ago: one tab per year, a pivot per question, a rep file rebuilt by hand every month. The numbers are right, but nothing behind them is reachable. You see a total drop $90K and spend the afternoon working out which dealers did it.

Sales Intelligence Suite starts from the opposite premise. Every total on screen is the sum of specific invoice-level rows, and one click opens exactly those rows. Growth, decline, churn, new dealers and reactivations are decomposed so that the parts add back to the total, to the dollar, and the interface tells you so.

It is delivered as a single HTML file: no server, no login, no installation, no data pipeline to maintain. Export your sales, inventory and backorder queries from SAP Business One, drop the workbook on the page, and the full year is live.

1	10	4	0
Self-contained file; any modern browser, online or offline	Modules, from executive summary to SKU-level price effects	Years of history compared, aligned to the same calendar day	Rows of your data leave your machine

The spreadsheet workflow

- A pivot answers one question; the next question means a new pivot
- Rep reports rebuilt by hand, margin columns deleted and hoped-for
- Renamed dealers in SAP show up as one churned account and one new one
- Year-to-date compares a full June against a half June
- “Why did the brand drop?” is a manual reconciliation

Sales Intelligence Suite

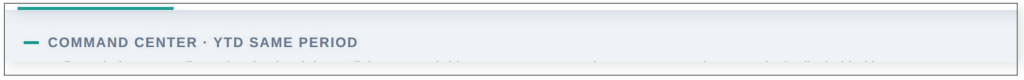

- Any figure opens the dealer list,invoice rows or SKU break-down behind it
- Rep-scoped exports and emails generated per rep, with pricing and margin excluded by design
- Dealer merges and book transfers baked into the file, so history stays continuous
- Comparisons aligned to the same day of the month across both years
- Change decomposed into new,reactivated, growth, decline and churn that reconcile exactly

The decomposition strip from the Command Center. The five terms are computed per dealer and summed; the tick appears only when they match the headline delta.

Ten modules, one navigation bar, one dataset.

Filters set at the top apply everywhere. Change the comparison basis, pick a brand or a rep, and every module recalculates from the same rows.

1 Command Center

Headline KPIs, monthly trend against last year, exact decomposition of the change, sales bridge, customer-base health, brand momentum, rep territories and the top actions from the ledger.

2 Dealer 360

A visit brief for a single account: same-months sales, trailing twelve, order recency, open backorders and a plain-language list of facts to bring into the meeting.

3 Price·Volume·Mix

Why sales moved. Volume effect, price effect, new lines and discontinued lines, per brand and per item group, with SKU-level detail on expand.

4 Recovery Ledger

A scored, prioritised queue of dealers to act on today: overdue, stopped buying, pace drops, seasonal misses. Each row carries its evidence and a suggested pitch.

5 Report Builder

An Excel-style pivot built by dragging fields. Double-click any cell to open the underlying rows and download them as a workbook.

6 Campaigns

Ready-made audiences derived from buying behaviour: winback, pre-season push, cross-sell gaps. Export each as a dealer list with the owner rep attached.

7 Inventory & Backorders

Open backorder book with stockconstrained versus ready-to-ship lines, inventory on hand by brand, and dealer-level backorder detail.

8 Reps

Coaching scorecard per rep: sales, growth, lost and declining dealers, new dealers, reactivations, and brands where the book is growing or shrinking.

9 Brands

Brand portfolio cards and a Brand Cockpit per brand: monthly trend, item-group performance, rep accountability, dealer coverage gaps and discontinued sell-through.

10 Settings

Dealer name merges, rep book transfers, discontinued brand status, marketplace accounts and rep email mapping. Save everything back into the file itself.

Brand decomposition — what drove each brand's change each row's parts sum exactly to its Δ

BRAND	2025	2026	Δ	LOST DEALERS	NEW DEALERS	EXISTING ▲	EXISTING ▼	PROOF
Orbit Audio	$204K	**$116K**	-$87,766	-$119,174 (2)	$0 (0)	$31,408	$0	audit →
Northline	$504K	**$475K**	-$28,597	-$102,491 (2)	$94,794 (2)	$54,048	-$74,948	audit →

Brand decomposition on the Command Center: for each brand, lost dealers, new dealers and existing-dealer growth and decline sum exactly to the brand's change. The audit link opens the dealers behind each cell.

Every number opens the list behind it.

The first screen is an executive summary, but nothing on it is a dead end. Click a KPI and a drawer slides in with every dealer that makes up the figure, sortable, searchable and ready to export.

1. Six headline cards: sales against the same months last year, decline and churn, new and reactivated, actionable value, active dealers, and the open backorder book.

2. The current month is drawn hollow and flagged as partial through today's date, so a half month is never mistaken for a weak one.

3. The dealer drawer: last year, this year, delta, status, rep, powergroup membership and the brands each dealer is buying now.

4. Sales bridge from last year to this year. Each segment is clickable and matches the decomposition strip exactly.

Compare the way you actually think about the year.

A single filter bar drives the whole suite. Set the basis once and every chart, table and export follows it.

1. Four comparison bases: year-to-date same period, full year, rolling twelve months and month-to-date. The banner spells out exactly which months are in play on each side.

2. Align to the same day. With this on, June 2026 through the 16th is compared with June 2025 through the 16th, not the whole month.

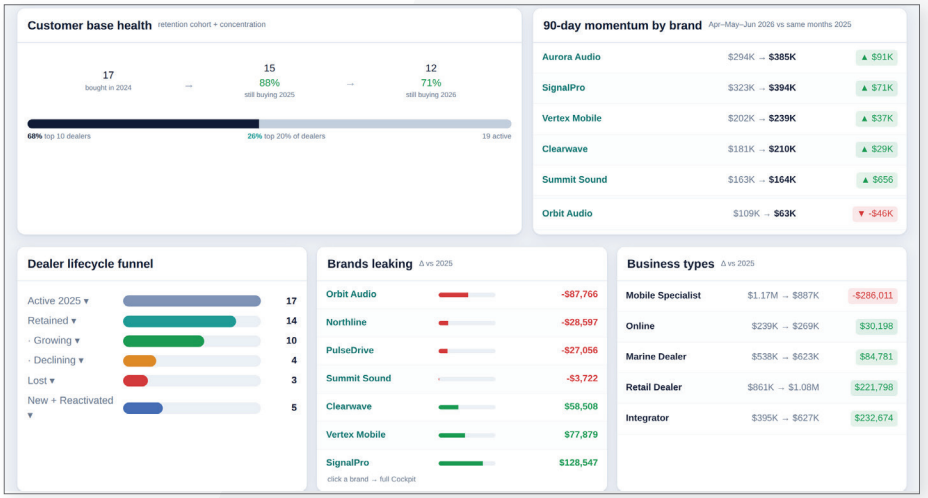

3. Month chips. Toggle individual months to isolate a season, a promotion window or a quarter.

4. Rep, brand, business type and channel selectors, plus a type-ahead dealer search that scopes the entire suite to one account.

5. Reset returns to the default view in one click. Discontinued brands remain selectable in their own group for wind-down analysis.

Above: the same bar with rolling twelve months selected. The comparison banner rewrites itself to show the two twelve-month windows now being compared, so the basis is never ambiguous to whoever is reading the screen or the exported report.

Every panel on the Command Center recalculates under the chosen basis: retention cohort and concentration, brand momentum, lifecycle funnel, brands leaking, business types,transfer-adjusted rep territories and the top actions from the Recovery Ledger.

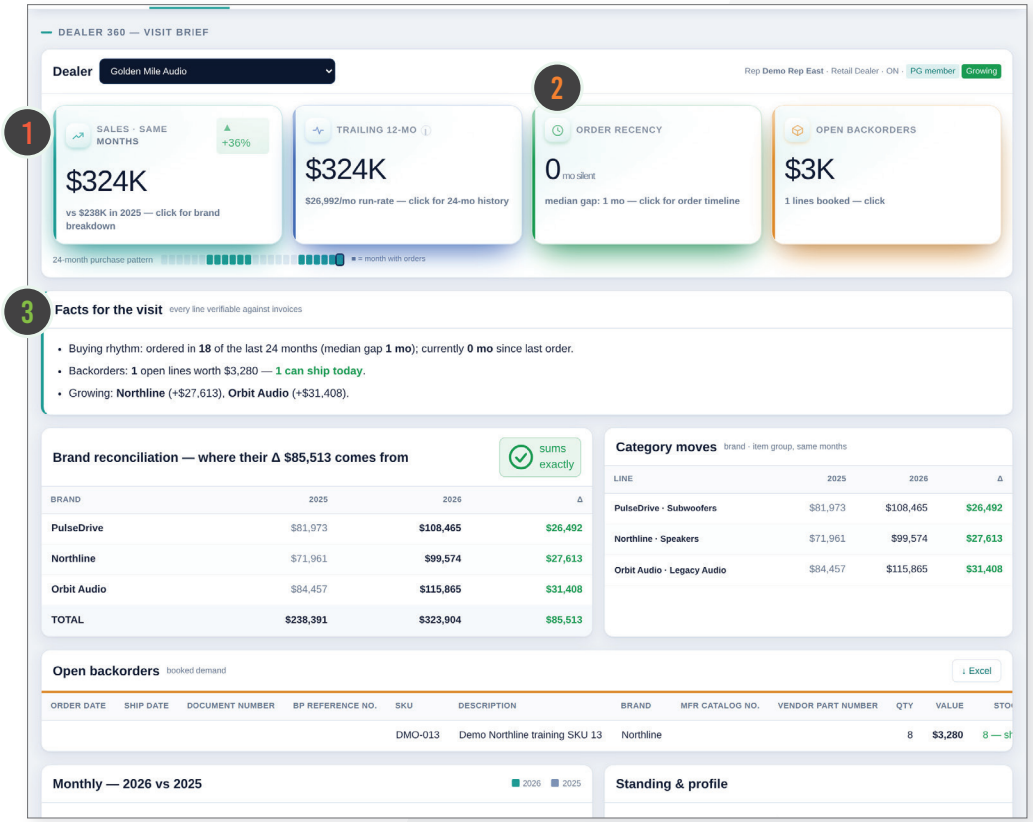

The visit brief, written from the invoices.

Pick a dealer and the module assembles what a rep needs before walking in: what they bought, how their rhythm compares with history, what is on backorder and what to raise.

1. Same-months sales against last year, with the growing, declining or churned label the rest of the suite uses.

2. Trailing twelve months, order recency with the median gap between orders, and open back-order value.

3. Facts for the visit: a generated, plain-language list of verifiable observations, such as the brands growing, the brands that stopped, and lines that can ship today

Dealer 360 respects the audience. When the file is exported for a rep, the dealer view shows sales and quantities but never dealer net price or margin.

Why sales moved, not just that they did.

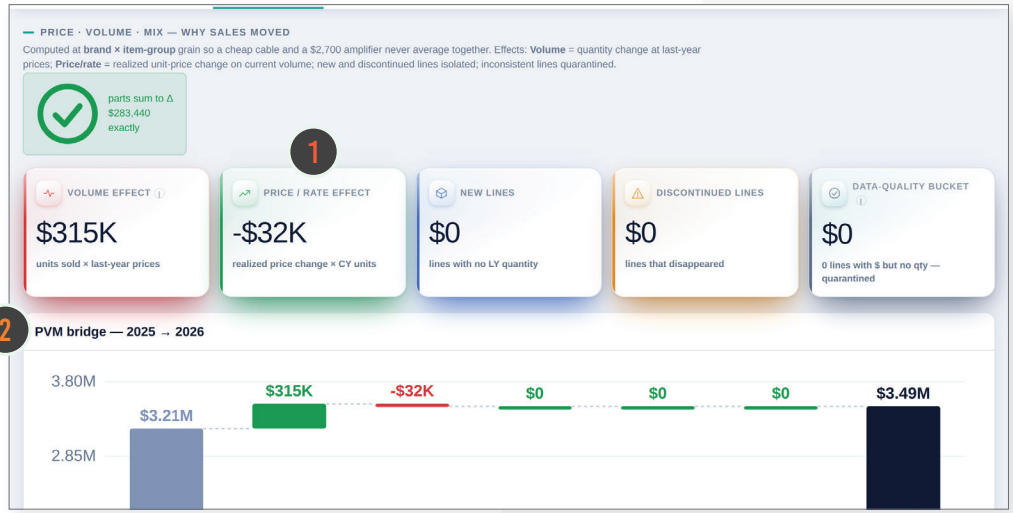

A brand can be up while its prices fell, or down while it took a price increase. PVM separates the two and adds the lines that arrived and the lines that disappeared.

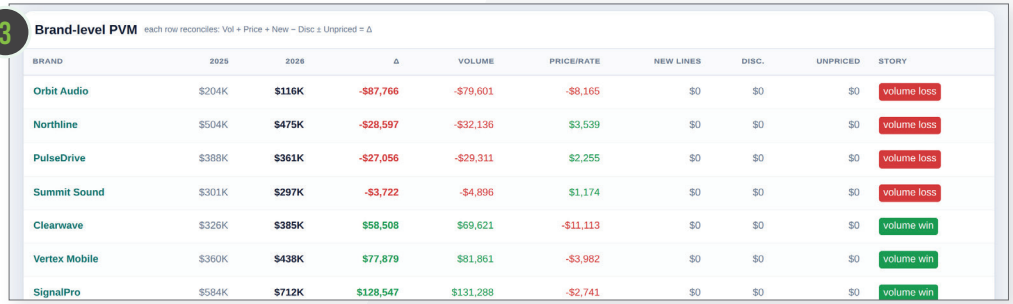

1. Five effects that sum to the total change: volume, price and rate, new lines, discontinued lines, and a data-quality bucket for lines with no comparable quantity.

2. The PVM bridge from last year to this year, with the reconciliation check shown beside it.

3. Brand-level table, expandable to item group and then to individual SKUs, each with its own volume and price decomposition.

Owner view shows the full five-column breakdown including average dealer net price. Rep view is gated to quantity and volume dollars only.

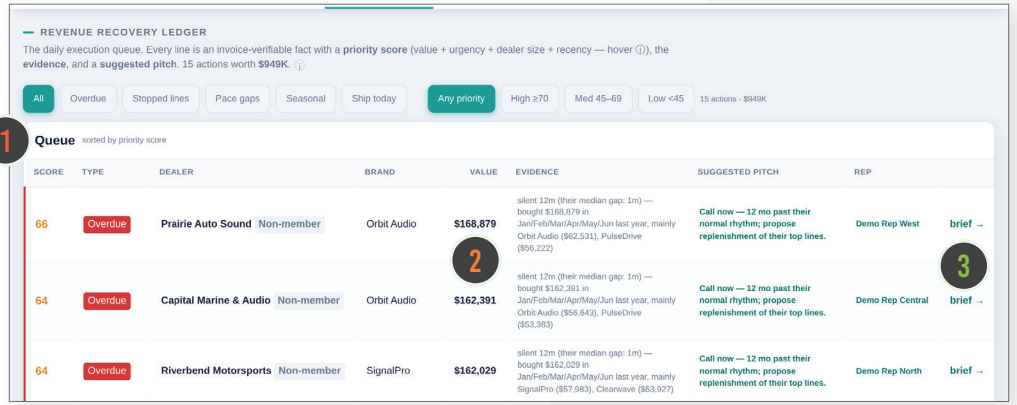

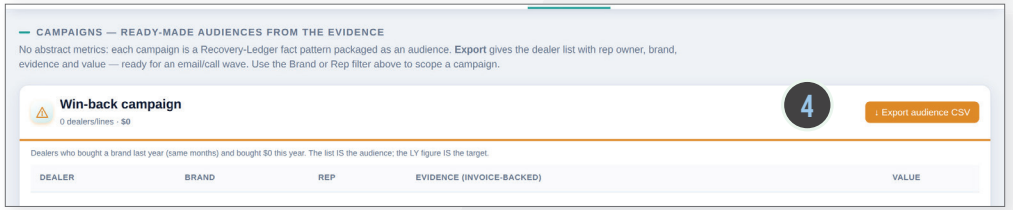

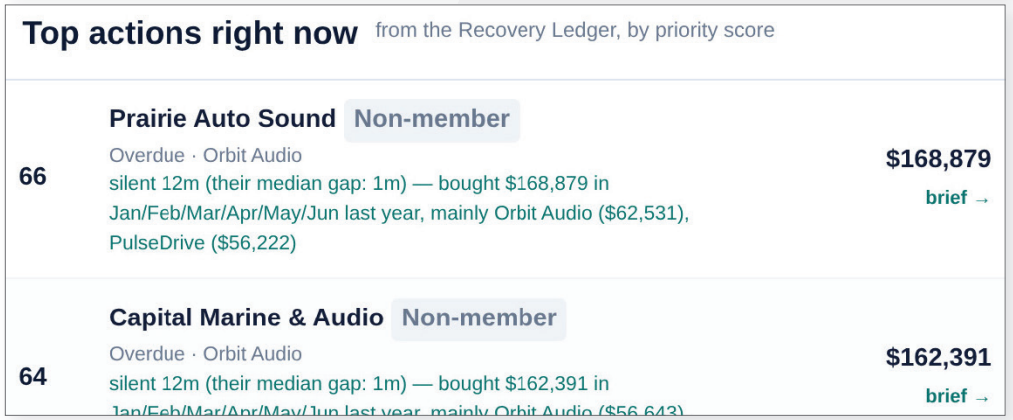

A to-do list scored from the evidence.

The ledger turns the whole customer base into a ranked queue. Campaigns turn the same evidence into audiences a marketing team can act on.

1. Priority score combines value, urgency, dealer size and recency. Filter to overdue, stopped lines, pace drops, seasonal misses or lines that can ship today.
2. Each row carries its evidence: months silent, what they used to buy and how much, which brands, which rep. A suggested pitch is written from those facts.
3. One click opens the Dealer 360 brief for that account.
4. Campaign audiences, win-back, pre-season push and more, are exported as CSV with dealer, brand, rep and evidence columns.

The top three ledger actions also surface on the Command Center, so the day's priorities are visible without opening the ledger.

The pivot table your team already knows, with the rows behind every cell.

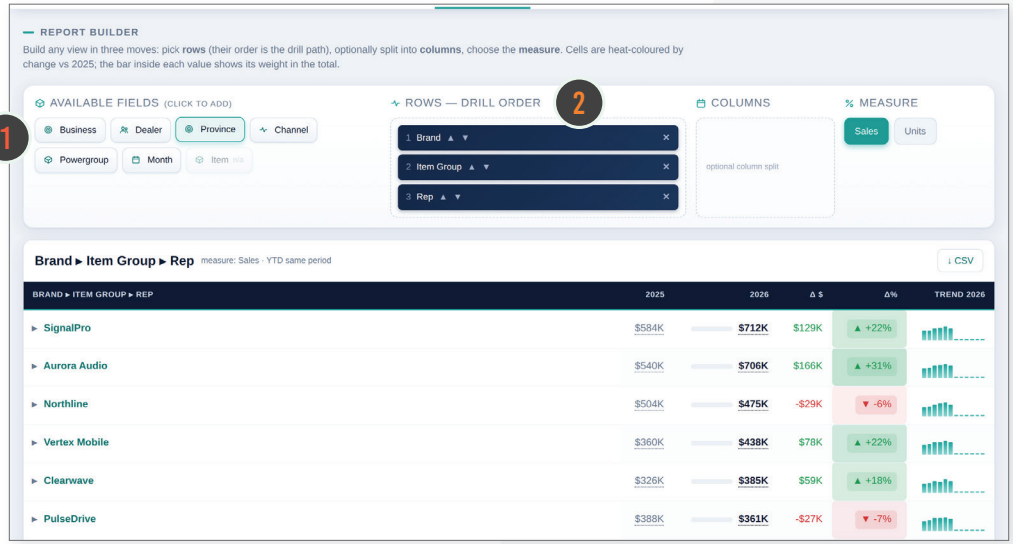

For the questions no dashboard anticipated. Build rows and columns by clicking or dragging fields, choose the measure, and read the result as a pivot with sparklines and deltas.

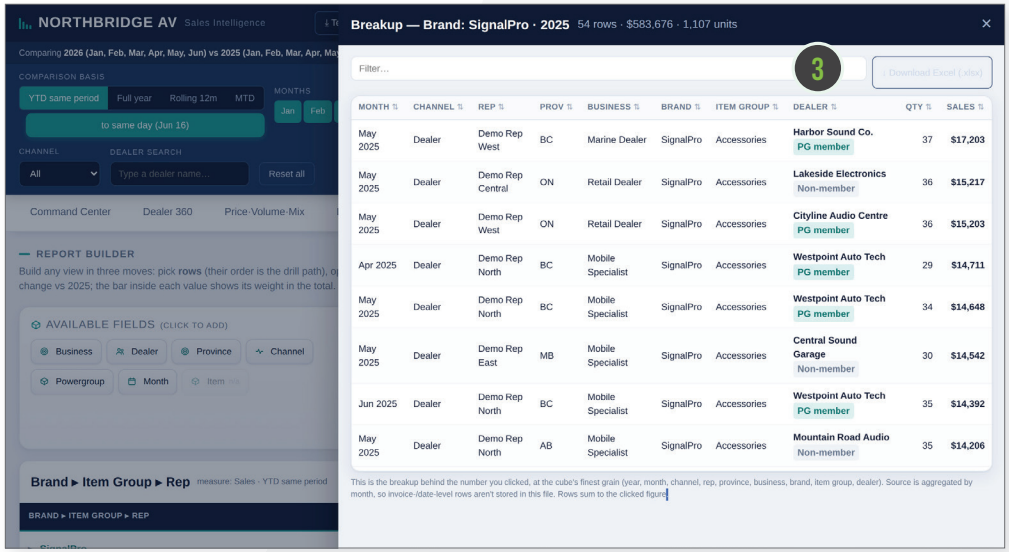

1. Fields: business, item group, dealer, rep, province, channel, powergroup, month, brand. Fields not present in the loaded file are shown greyed rather than hidden.

2. Drill order. Rows nest in the order you place them; drag to reorder.

3. Double-click any value to open the underlying cube rows in a filterable overlay, then download them as an Excel workbook. Granularity is stated plainly: month-level.

Excel export is bundled inside the file, so downloads work offline and without any add-in.

Which orders can ship today, and which are waiting on a container.

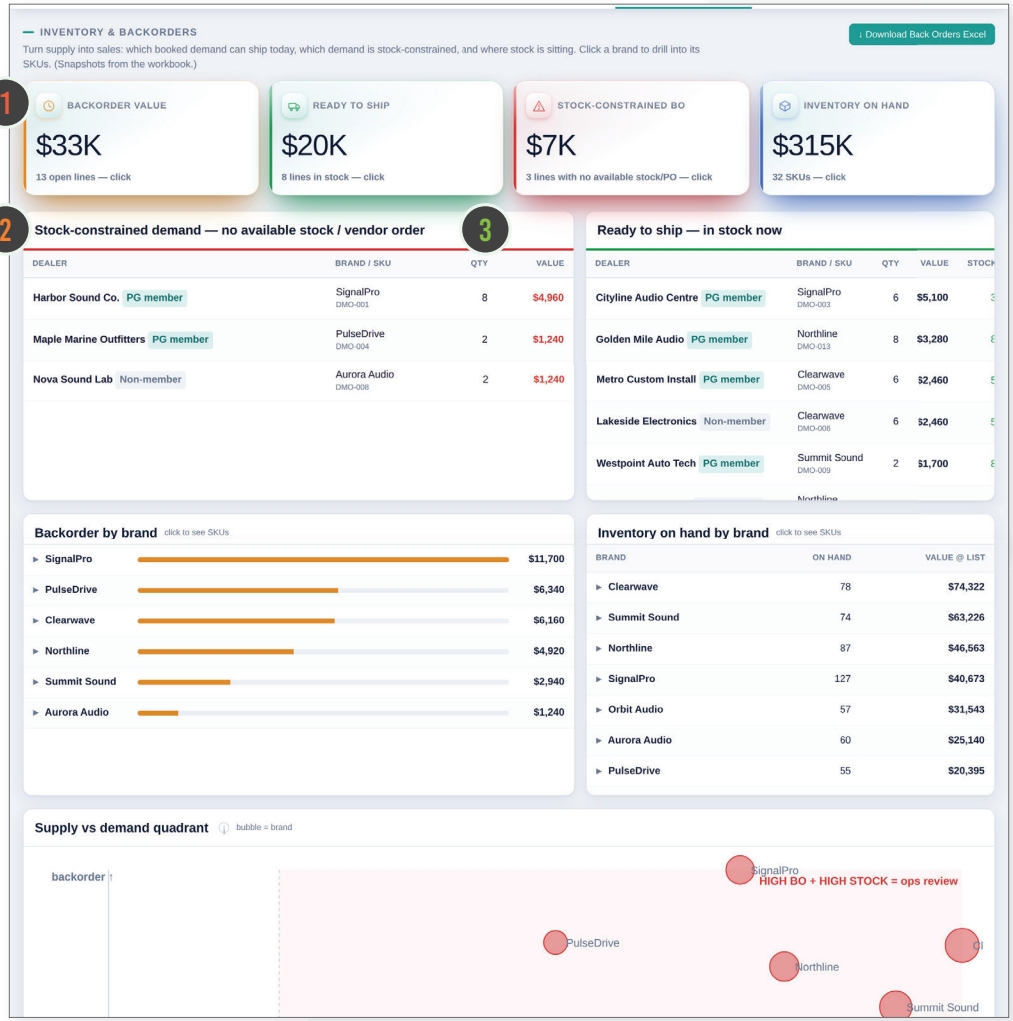

Sales history is only half the story for a distributor. This module joins open sales orders with stock on hand so the team can see demand that is fulfillable now versus demand that is constrained.

1. Backorder value, ready-to-ship value, stock-constrained value and inventory on hand, each opening the line-level list.

2. Stock-constrained demand: dealer, brand and SKU, quantity and value, where no stock and no vendor order exists.

3. Ready to ship: lines with stock available now, so the warehouse can release them or the rep can call the dealer.

Backorder detail also appears on Dealer 360 and the Recovery Ledger, and every table has a Download Excel button.

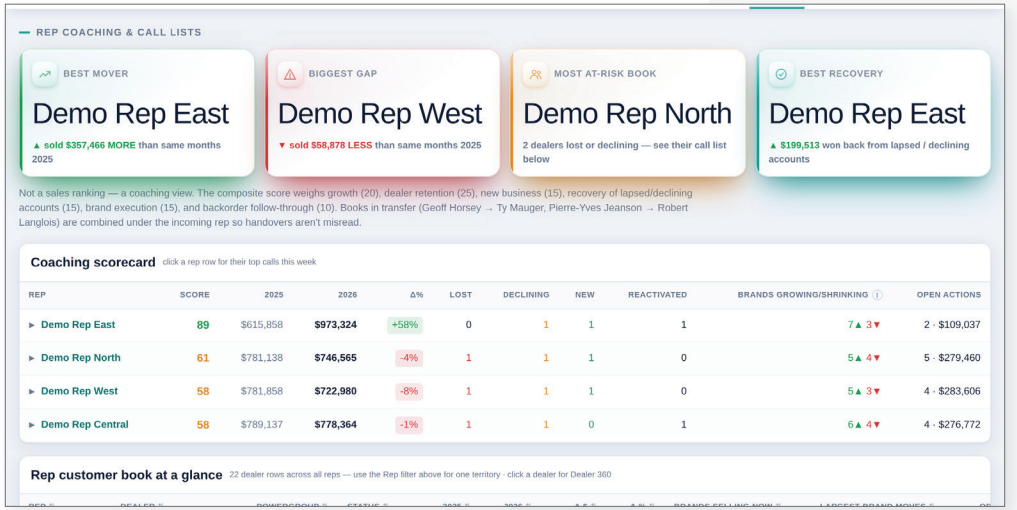

Accountability in both directions.

The Reps module reads a territory the way a sales manager would. The Brands module reads a supplier relationship the way a category manager would. Both drill down to the same dealers.

1. Coaching scorecard: sales, growth, lost, declining, new and reactivated dealers per rep, plus which brands the rep is growing and shrinking. Written as a coaching view, not a leaderboard.

2. Brand portfolio cards with share, growth, dealer counts and a three-year sparkline. Any card opens the Brand Cockpit.

3. Brand Cockpit: monthly trend against last year, item-group performance, rep accountability, dealers not yet carrying the brand, and discontinued sell-through.

Put the right version in every rep's inbox.

Head office sees everything. Each rep sees their own book, with the same interactivity, and without a single price or margin figure. The suite generates those versions for you.

1. Export rep: a standalone copy of the suite locked to one rep's dealers. Export ALL reps produces the full set in one action.

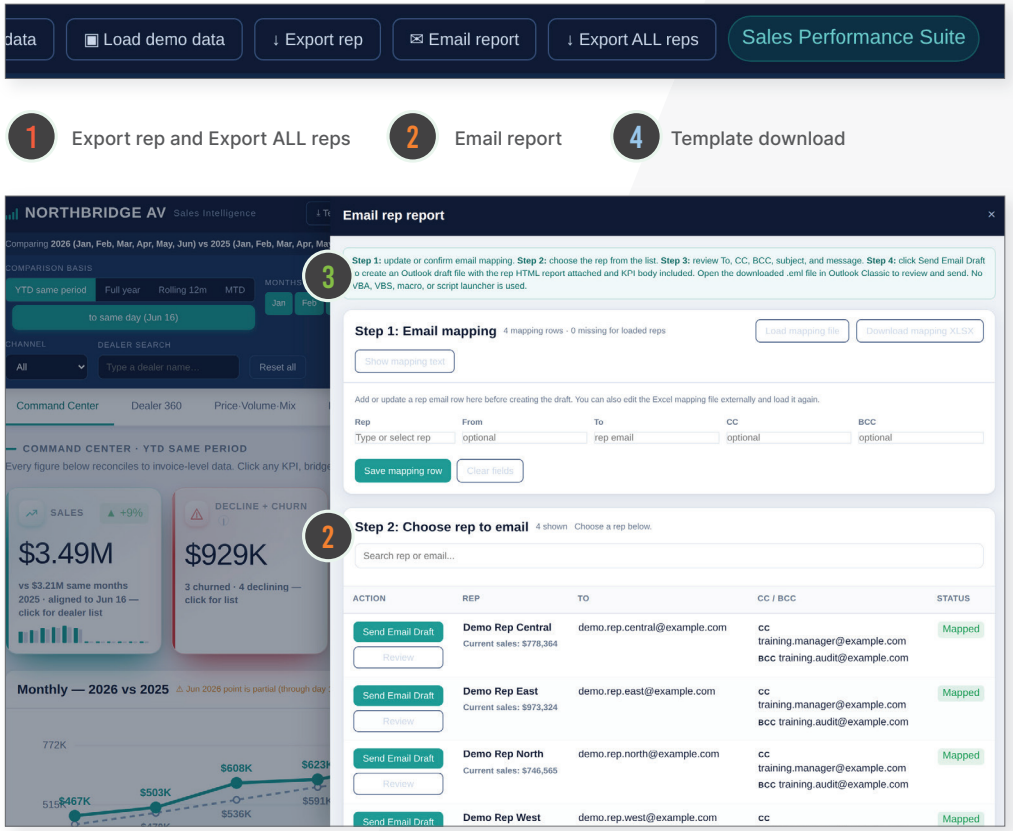

2. Email report: map rep names to email, CC and BCC once, then choose a rep and send. Drafts open in Outlook, or download as .eml or HTML.

3. The body carries the key numbers and the comparison basis in plain text, so it reads correctly on a phone before the attachment is opened.

4. Excel downloads everywhere: pivot drill-throughs, backorder tables, campaign audiences and the master template for loading data.

DATA BOUNDARY

Rep exports are gated at the code level. Dealer net price, gross profit and margin never render in a repscoped file, in any module, drawer or download.

The email dialog. Step one maps each rep to their address once and keeps the mapping in the file. Step two lists reps with their recipients and status, with a Send Email Draft action per rep that opens a ready-addressed draft with the rep's report attached.

NORTHBRIDGE AV Sales Intelligence · latest year auto-detected: 2026 · sales metrics only — margin data excluded by design

The status line of a rep-scoped file states the boundary in the product itself: sales metrics only, margin data excluded by design.

The corrections your data always needed, kept in one place.

Real ERP data has renamed accounts, reassigned territories and brands being wound down. Settings lets you state those facts once and bake them into the file, so every refresh inherits them.

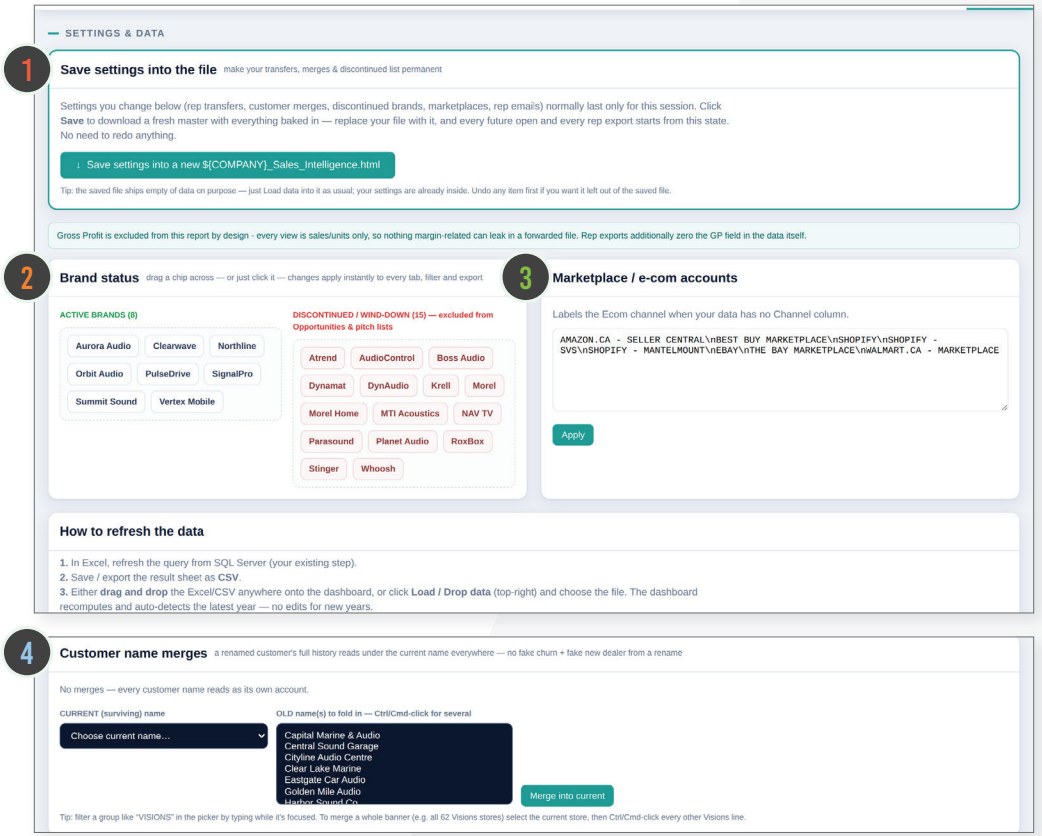

1. Save settings into the file. Transfers, merges, brand status, marketplaces and rep emails are written into a new copy of the suite; that copy becomes the master.

2. Brand status: mark brands discontinued. They stay selectable in their own group for sellthrough analysis instead of vanishing from reports.

3. Marketplace and e-commerce accounts, so Amazon, Shopify and similar channels can be separated from dealer sales.

4. Rep book transfers and many-to-one dealer name merges. A banner consolidation stops appearing as one churned dealer and one new one.

One file serves several companies. The primary product dimension switches automatically between brand and item group depending on which company's workbook is loaded.

From ERP export to a live suite in four steps.

Built and refined on SAP Business One. Any system that can export sales lines, open orders and stock on hand to Excel can feed it.

1

Run the queries

Three saved queries in your ERP: sales lines (invoices and credits), open sales orders with stock position, and inventory on hand.

We supply the SAP Business One versions.

2

Fill the template

Paste the results into the Data, Back order and Inventory sheets of the template workbook. The template is downloadable from the suite itself.

3

Drop the workbook

Drag the file onto the page. Years are detected automatically, the company is recognised from the file, and saved corrections are applied.

4

Analyse and distribute

Work in the owner view, then export or email the rep-scoped versions. Save the file with data embedded, or keep it as a template and refresh monthly.

Your data stays yours

The suite is a file on your computer or your network drive. It makes no network calls. Nothing is uploaded, indexed or seen by anyone outside your business.

No IT project

No server, database, licence server or installer. It opens in Chrome, Edge or Safari. Sharing it is sending a file.

Verified behaviour

Every release is checked programmatically, including reconciliation of decomposition and PVM math to the cent across synthetic and live data, and gating of rep-scoped views.
